

# Human behavior and exposure to mosquitos

Neil F. Lobo

Using data to inform optimal selection of core interventions

February, 2022

VCWG, Ghana

# Concept

- Interventions work based on **their overlap with vector behavior**
- Human behavior is super important (and oft ignored) in exposure
- Key considerations are
  - **When and where** are humans and vectors (behaviors) overlapping → exposure
  - What are these human activities?
  - How do these behaviors impact **intervention usage / functionality?**

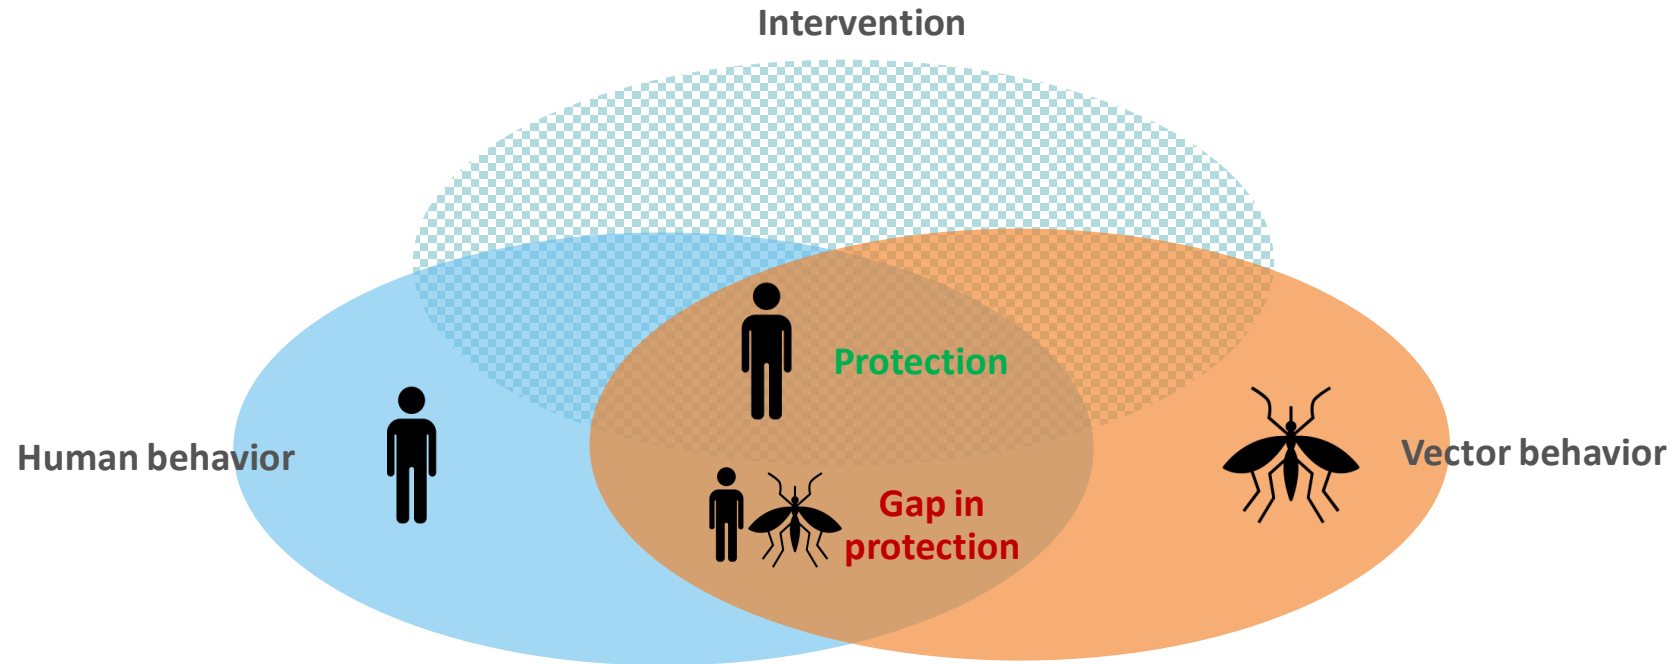

Garrett-Jones C: A method for estimating the man-biting rate. World Health Organization; 1964.

Monroe A, et. al. Malar J. 2020 Jun 16;19(1):207. Methods and indicators for measuring patterns of human exposure to malaria vectors.

# Integrating **vector** and **human behavior** data to identify **gaps in protection**

- Vector control interventions target specific vector behaviors.
- Interventions protect humans from mosquito bites when human behavior and the vector behavior targeted by the intervention overlap.

# Integration of **vector** and **human behavior** data

Vector biting data analyzed *with* human behavior data, we obtain the **adjusted HBR**.

→ The **adjusted HBR** is the **HBR** for each activity.

→ The adjusted HBR quantifies **protection and gaps in protection**.

Proportions of  
people doing  
specific activities

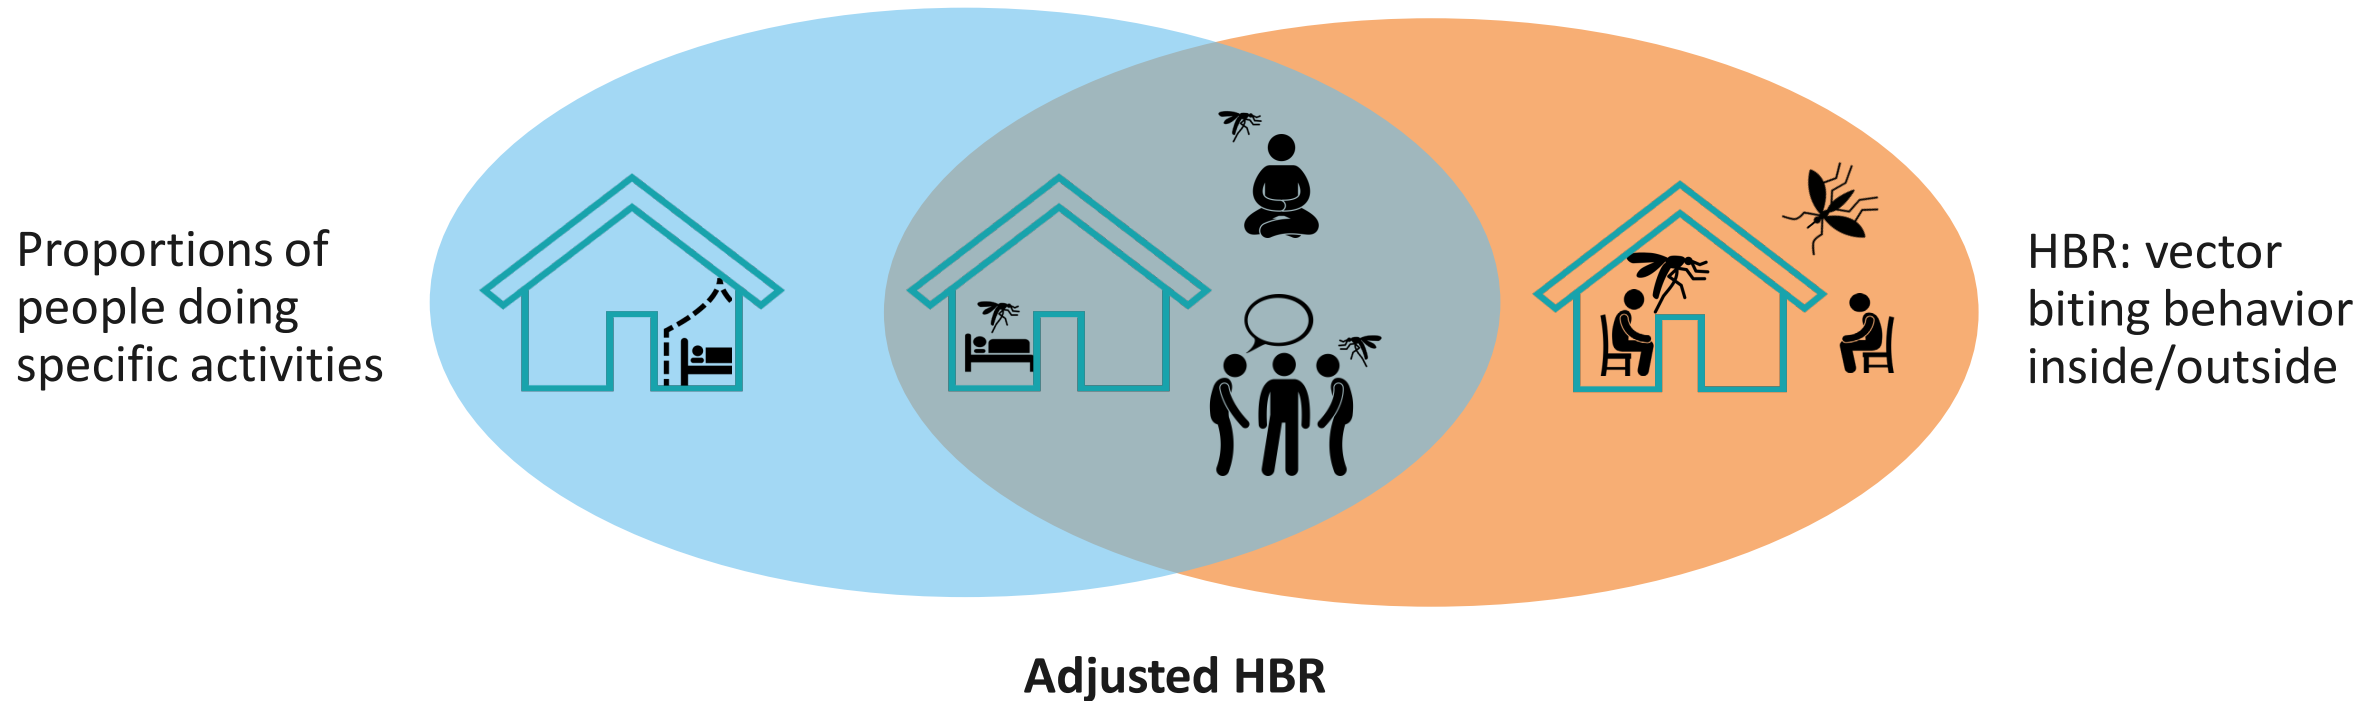

HBR: vector  
biting behavior  
inside/outside

# Integration of **vector** and **human behavior** data

Vector biting data analyzed *with* human behavior data, we obtain the **adjusted HBR**.

→ The **adjusted HBR** is the **HBR** for each activity.

→ The adjusted HBR quantifies **protection** and **gaps in protection**.

# Panama – Quantified spatial and temporal exposure resulted in reduced exposure

Elodie Vajda

c. Proportion of human population observed sleeping or awake, inside or outside, under or not under an LLIN, superimposed with *Anopheles* hourly HBR in Permé (Aug 2019)

# Panama – Quantified spatial and temporal exposure resulted in reduced exposure

Elodie Vajda

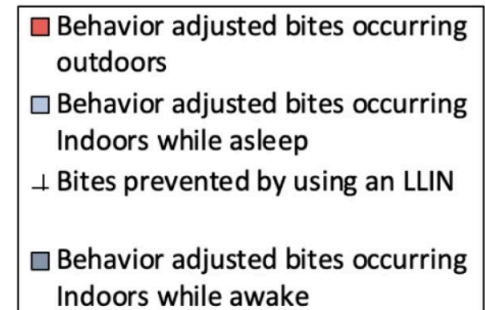

c. Proportion of human population observed sleeping or awake, inside or outside, under or not under an LLIN, superimposed with *Anopheles* hourly HBR in Permé (Aug 2019)

Ávila MI, et. al. Malar J. 2021 Nov. Entomological Surveillance Planning Tool -generated actionable evidence on human and vector behaviours optimizes present interventions and reduces exposure to *Anopheles* vectors in two communities of Guna Yala, Panamá. 24;20(1):443.

Hourly **HBO-adjusted HBR** from 1800-0600h to account for human presence and LLIN use

# Panama – Quantified spatial and temporal exposure resulted in reduced exposure

LSM: Larval Source management; SR: Spatial Repellants; TR: Topical Repellants

# Ethiopia: Lowlands vs. highlands / Resident vs. Migrant exposure

**RESIDENT  
LOWLAND**

Adjusted rate: Indoors awake  
Adjusted rate: outdoors awake

**SEASONAL  
MIGRANT  
WORKERS**

Adjusted rate: indoors, asleep, without LLIN  
Adjusted rate: outdoors asleep without LLIN

**RESIDENT  
HIGHLAND**

# Indonesia – Human behavior analysis demonstrated protections by spatial repellents

I. Ekoprayitno Rozi

## Primary trial:

- **16%** reduction in vector landing resulted in a **60%** protective efficacy (in cohort of <5yo)

## Secondary analysis:

- Vector landing rates were analyzed alongside HBOs (community wide)
- There was a **28% reduction in the human behavior adjusted landing rates** in intervention versus control clusters

# Cambodia – Multiple intervention paradigms - Forest packs that addresses all spatial and temporal exposure

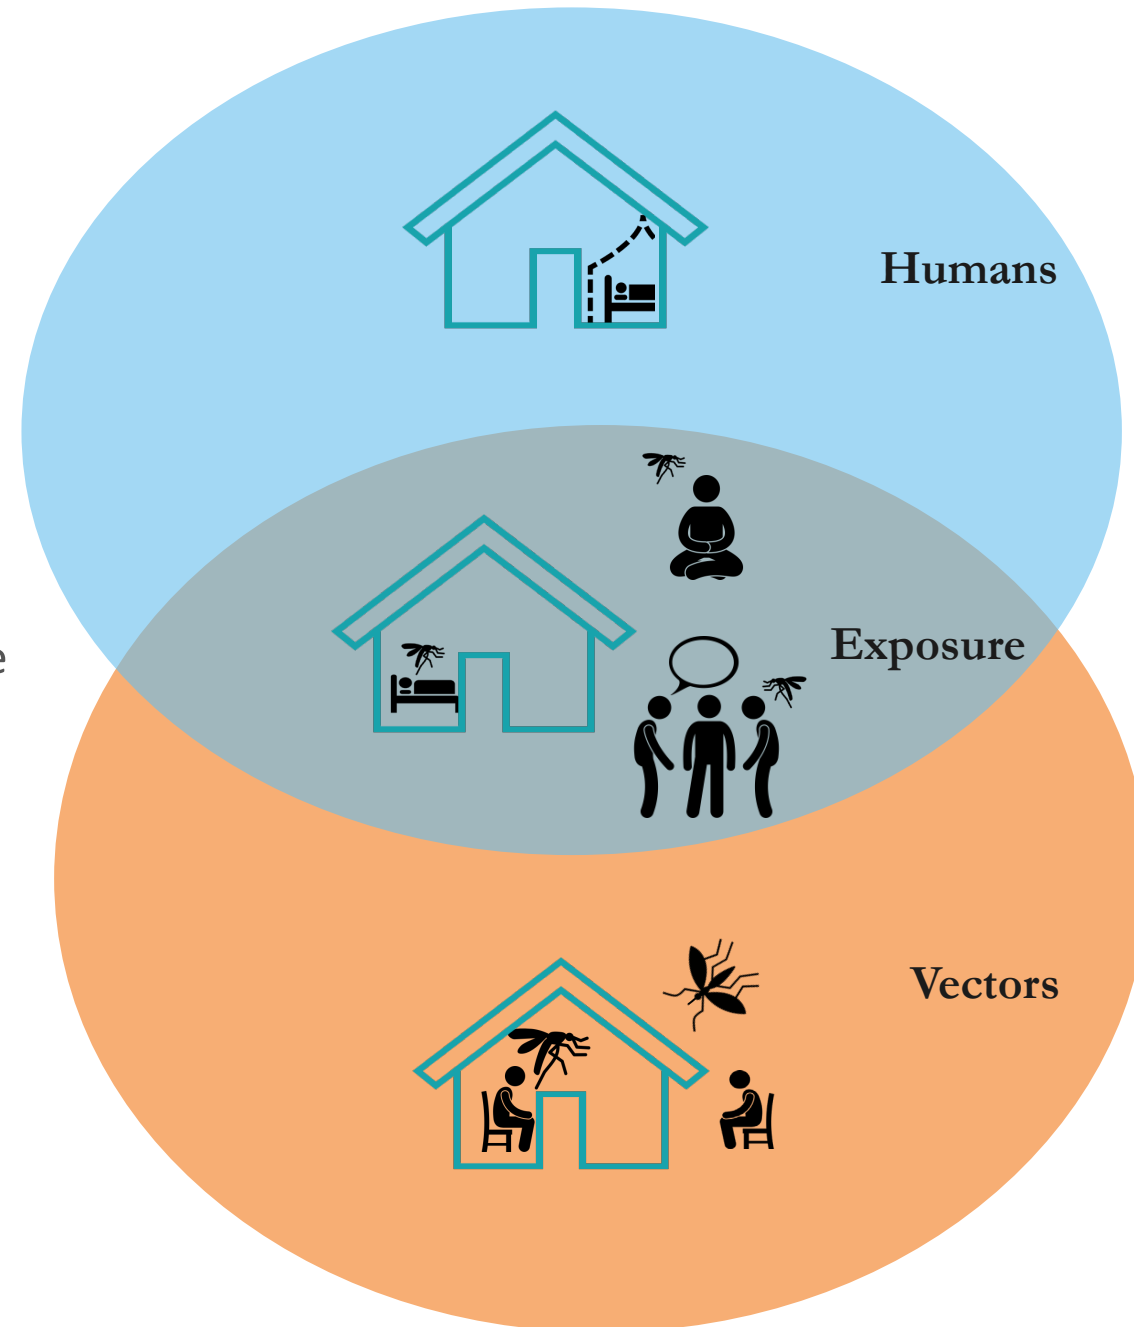

Exposure space and activity	Intervention type
Temporary structure (sleeping, resting)	<ul style="list-style-type: none"><li>- Passive Volatile Pyrethroid Spatial Repellent (VPSR)</li><li>- Spatial Repellent spray</li><li>- Treated clothing</li><li>- Topical repellent</li></ul>
Outside temporary structure (eating, resting, work)	<ul style="list-style-type: none"><li>- Passive VPSR</li><li>- Spatial Repellent spray</li><li>- Treated clothing</li><li>- Topical repellent</li></ul>
Forest (work, foraging)	<ul style="list-style-type: none"><li>- Treated clothing</li><li>- Topical repellent</li></ul>

# Value of HBOs

- Understanding exposure better
- Evaluating an intervention - functionality
  - Efficacy
    - Not just LLINs
      - IRS
      - SRs, ITC...
    - Species specific impacts of an intervention on exposure
- Evaluating how an intervention is **NOT** functioning
  - Optimization of core interventions
  - Gaps in protection with core interventions
  - Solutions
- Layering of interventions
  - Targeting and tailoring
- Human behavioral component
  - Value of Social and Behavior Change Communication (SBCC)

**Bangladesh**<sup>1</sup> – Household level human behaviors can direct exposure

**Ecuador**<sup>2</sup> – Primary indoor exposure with exophagic vectors

**Indonesia**<sup>3</sup> – Human behavior analysis demonstrated protections by spatial repellents

**Namibia**<sup>4</sup> – exposure based on human-vector interactions by site

**Panama**<sup>5</sup> – Quantified spatial and temporal exposure resulted in reduced exposure

**Ethiopia** – ongoing : Target group specific and site differences in exposure

**Cambodia** – ongoing: evaluation HBOs with VPSR, TRs, ITCs
