

# Raising the Floor on Nets Update

Amanda McCoy and Eddie Thomsen

VCWG

03 May 2022

BILL & MELINDA  
GATES *foundation*

SAVE MORE LIVES

BETTER ACCESS TO SAFE, HIGH QUALITY,  
EFFICACIOUS VECTOR CONTROL TOOLS

OUTCOMES

Quality management system drives continual improvement in ITN quality

Improved communication and trust among stakeholders

Countries supported to make informed decisions on quality

Procurers use data to make value-based decisions

Quality and innovation are incentivized

Product specifications represent attributes that correlate with performance

Methods are standardized and results more consistent

OUTPUTS

Revised physical and chemical specification requirements

Fit for purpose methods validated

Revised product change guidance

Reports on wash resistance, AI/bioefficacy relationship

New editions of product testing guidelines

ISO 9001+ specific for ITN manufacturing

Data landscaping report

Database / data sharing platform

Blueprint for external quality assurance scheme for ITN testing facilities

ITN testing facility capacity assessments and action plans

ITN market analysis report

Manufacturer quality management system risk stratification

Context-relevant procurement model

ITN quality guidance for regulators and NMCPs

Post distribution data toolkit

Case studies providing examples success and challenges of QA system

ACTIVITIES

### Quality and Performance Metrics

Link product specifications with performance

Revise product testing guidelines

### Robust QA process

Develop QMS standards specific to ITN manufacturing

Improve consistency of ITN lab testing results

Improve transparency

### Incentives for Quality and Innovation

ITN market analysis to identify drivers of quality and value

Enhance procurement model and shape market to reward quality and innovation

### Country Stewardship

Harmonize in-country approach to quality & performance management

Improve regulatory preparedness for quality

Communication, Clarity, Trust, Transparency

# Activities that underpin the ToC

OUTCOMES

Quality management system drives continual improvement in ITN quality

Improved communication and trust among stakeholders

Countries supported to make informed decisions on quality

Procurers use data to make value-based decisions

Quality and innovation are incentivized

Product specifications represent attributes that correlate with performance

Methods are standardized and results more consistent

OUTPUTS

Revised physical and chemical specification requirements

Fit for purpose methods validated

ITN testing facility capacity assessments and action plans

ITN market analysis report

Manufacturer quality management system risk stratification

Context-relevant procurement model

ITN quality guidance for regulators and NMCPs

Post distribution data toolkit

Case studies providing examples success and challenges of QA system

ACTIVITIES

## Quality and Performance Metrics

Link product specifications with performance

Revise product testing guidelines

## Robust QA process

Develop QMS standards specific to ITN manufacturing

Improve consistency of ITN lab testing results

Improve transparency

## Incentives for Quality and Innovation

ITN market analysis to identify drivers of quality and value

Enhance procurement model and shape market to reward quality and innovation

## Country Stewardship

Harmonize in-country approach to quality & performance management

Improve regulatory preparedness for quality

Communication, Clarity, Trust, Transparency

Manufacturer QA landscaping

ITN quality case studies

ITN market and value metrics

# The quality triangle

- Alignment of specifications with expectations of performance

- QA audits
- QC best practice guidelines
- Testing to quality v performance

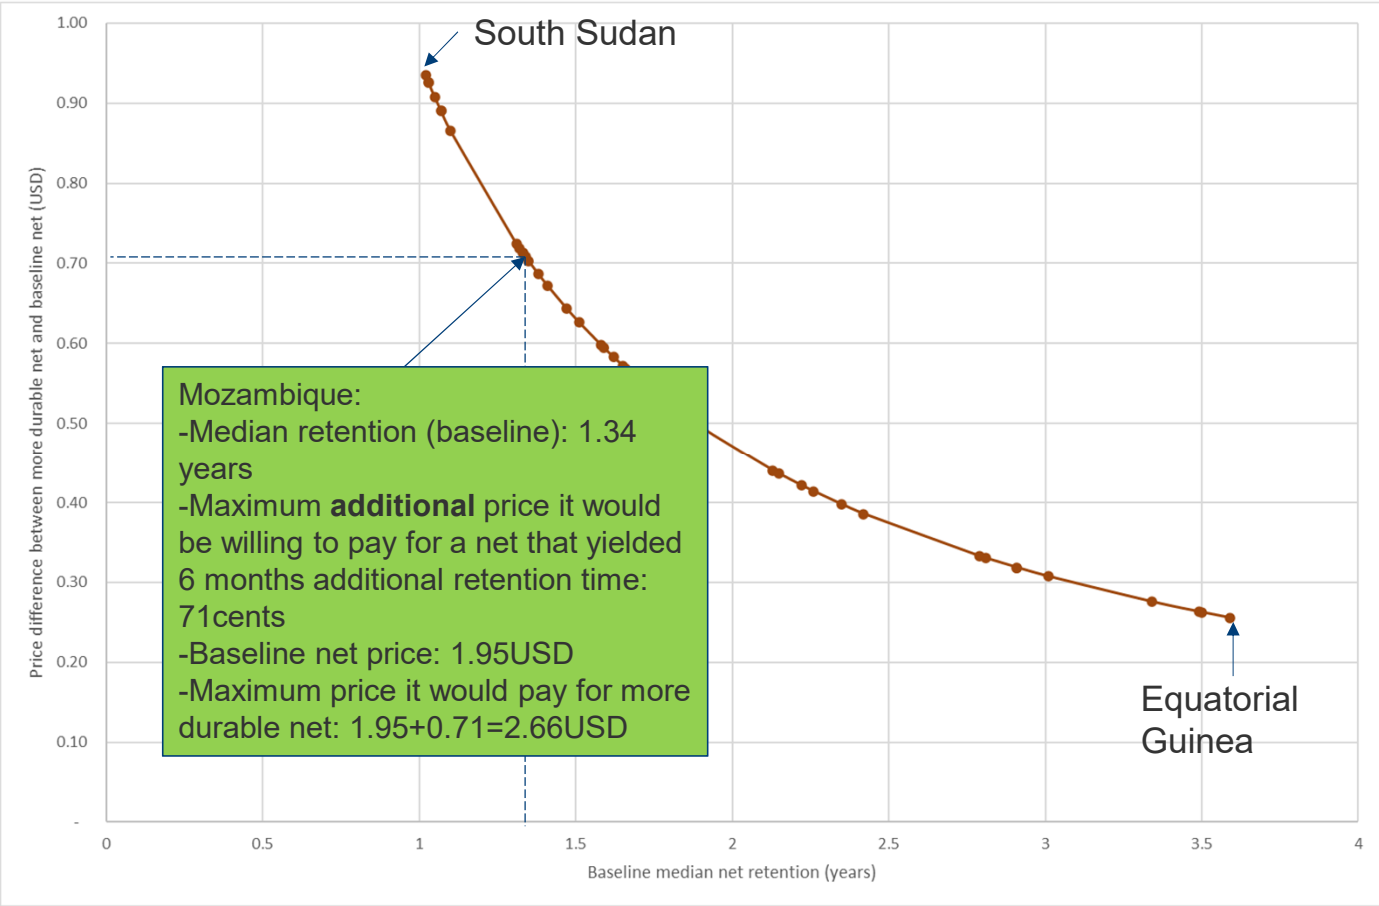

- Guidelines on changes to a pre-qualified product
- Manufacturer audits and risk stratification
- Product testing guidelines

# Marginal willingness-to-pay for a more durable net analysis

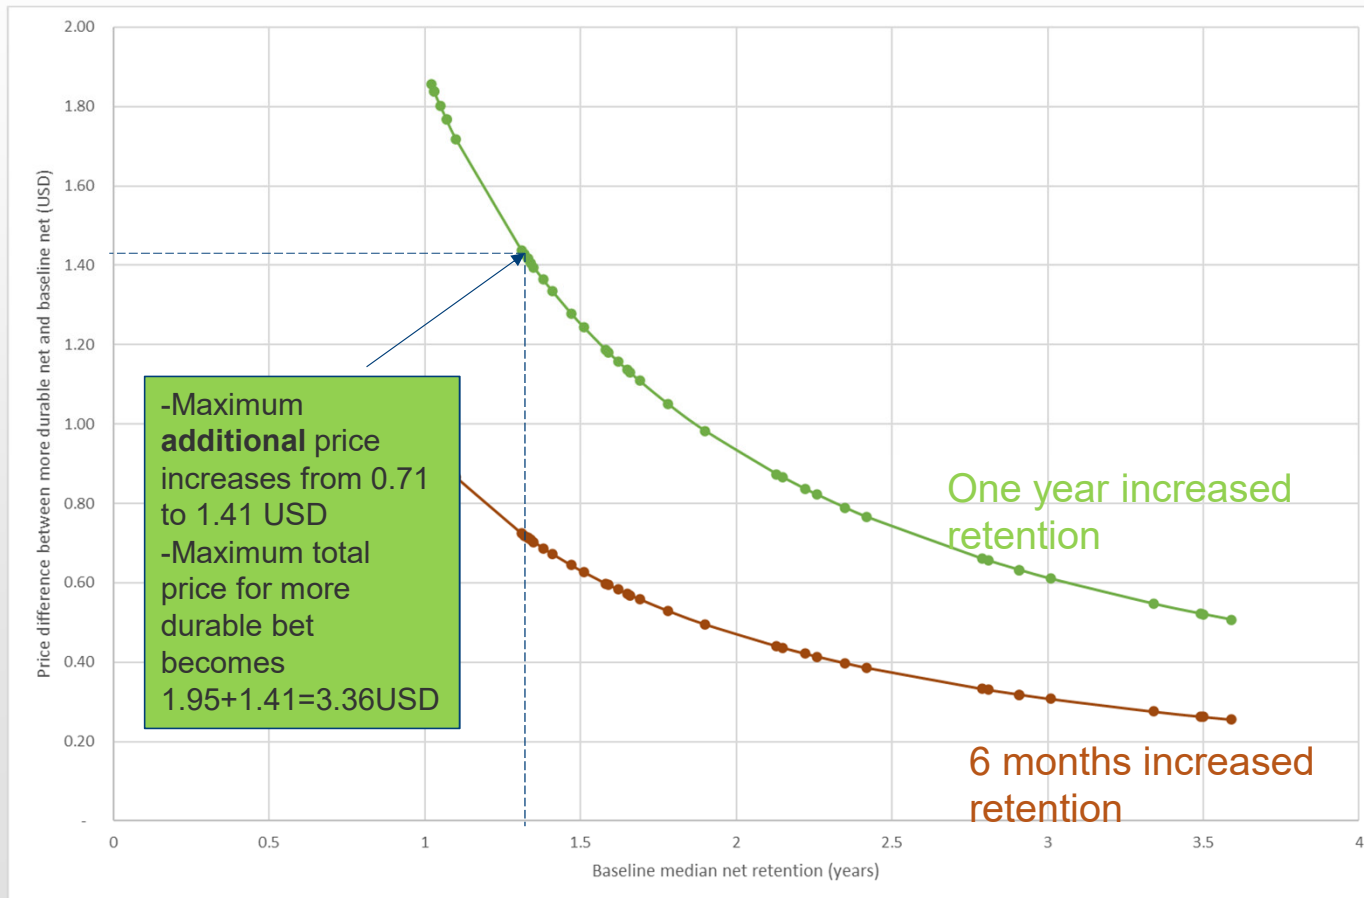

## Working towards a value metric to support ITN procurement of more durable nets

- How much more would a country/procurer be willing to pay, in theory, for a more durable net?
- This decision will be influenced by
  - How much does the baseline net last for? How much does it cost and what other costs need to be factored in (e.g. distribution)
  - How much longer does the more durable net last for?
- Finding the price threshold (maximum price a country would pay): Although a more durable net is likely to be more expensive, the *equivalent cost per year of retention* may be lower; at what price (of a more durable net) does this happen?
- Baseline data
  - Real life price data from Global Fund PQR and PMI database
  - Net retention data for 40 African countries (Bertozzi-Villa et al)

What is the maximum additional price that a country would pay for a more durable net (threshold for additional net price): 6 months additional retention

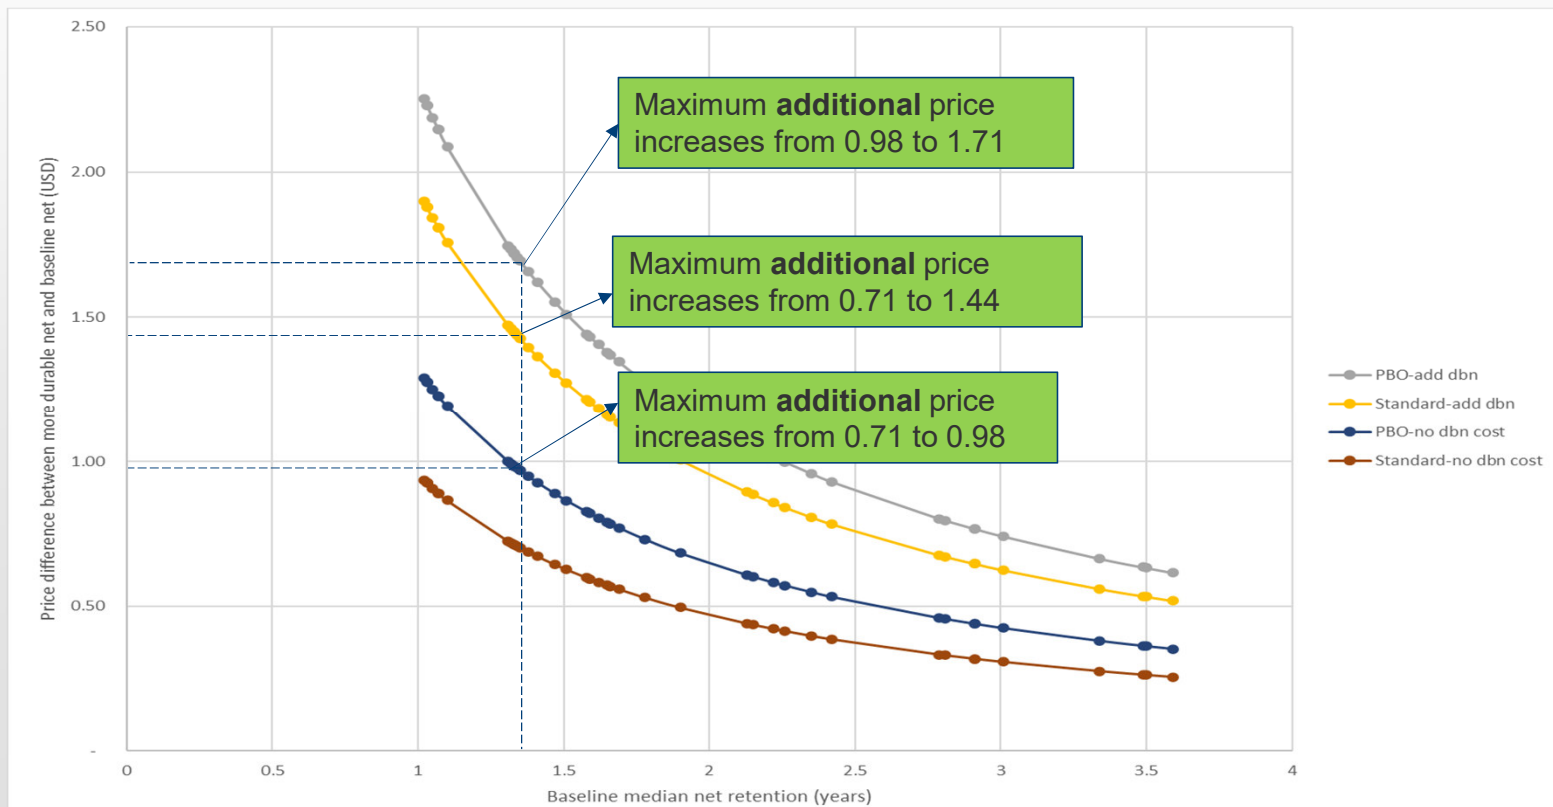

# What is the maximum additional price a country would pay: comparison of 6 months with one year increased retention

# What is the maximum additional price a country would pay: 6 months increased retention, comparing PBO vs standard net and adding distribution costs

## Key messages

- Potentially start thinking about market segmentation: which countries will yield the greatest return on investment for a more durable net?
- Results are highly sensitive to baseline costs
  - Baseline values may change (increased costs etc.)
  - Other costs (e.g. distribution) need to be included

## Next steps, based on stakeholder feedback

### Stage I

- Refine assumptions, define the most **relevant outputs**, sensitivity analysis
- Gain better understanding of realistic increase in (i) price and (ii) physical durability/retention time for a more durable net
- Can we link variation in functional life/retention with **Resistance to Damage (RD)** scores?

### Stage II

- Develop the analysis from country to province and district level (further data required)
- Look at the impact on total programme costs and coverage levels under different scenarios (varying durability and costs, factoring in replenishment needs and distribution costs)

### Stage III

- Develop an ITN procurement tool, that can be adapted to different settings, in order to facilitate decision making by country stakeholders

## Information sources

Variable	Source
Median net retention	<i>"Maps and metrics of insecticide-treated net access, use, and nets-per-capita in Africa from 2000-2020"</i> (Bertozzi-Villa et al, 2021)
Net prices	Combined GF-PQR and PMI database
Net distribution cost	<i>"Systematic review and meta-analysis of the cost and cost-effectiveness of distributing insecticide-treated nets for the prevention of malaria"</i> (Wisniewski et al, 2020)
Net price increase (%)	<i>"PBO net deep dive report"</i> (CHAI, 2021)
Equivalent annual cost	(Drummond et al, 2001)
Value of longer functional survival/net life	<i>"Comparative functional survival and equivalent annual cost of 3 long-lasting insecticidal net (LLIN) products in Tanzania: A randomised trial with 3-year follow up"</i> (Lorenz et al, 2020)
