## Using machine-learning and mid-infrared spectroscopy for rapid assessment of blood feeding histories and parasite infection rates in field collected malaria mosquitoes

### Objectives

This project proposes to couple MIR-spectroscopy with machine-learning algorithms and to validate them for rapid assessment of blood-feeding histories and infectiousness of field-collected *Anopheles arabiensis* and *Anopheles funestus*, which dominate malaria transmission in Tanzania.

The research team will calibrate the systems to identify different vertebrate blood meals in mosquito abdomen, and *Plasmodium* sporozoite in heads and thoraces. This field validation will enable scale-up of MIR based approaches, thereby significantly improving surveillance-responses and intervention monitoring.

### Principal Institution(s)

[Ifakara Health Institute \(IHI\)](#)

### Rationale and Abstract

Effective surveillance and control of malaria-transmitting mosquitoes requires quantitative understanding of key biological attributes, namely: preferred blood –hosts of mosquitoes, proportions infected with parasites, survivorship, indoor/outdoor-biting behaviour and insecticide susceptibility. Currently, identifying mosquito blood meals and *Plasmodium* infections involves enzyme-linked immunosorbent assays (ELISA), or polymerase chain reactions (PCR), which are time-consuming, laborious and require expensive reagents. However, advances in near-infrared spectroscopy (NIR) suggest the potential for a cheaper, quicker and non-invasive alternative for predicting age and species of mosquitoes, and detecting pathogens e.g Wolbachia and Zika virus in laboratory- infected *Aedes*. Promisingly, mid-infrared (MIR) can provide even better accuracies since structural identities of bio-molecules are delineated at finer resolutions than in NIR bands. However, the spectroscopy-based methods have not been field-validated because entomologist lack comparative field samples of known attributes and advanced computational methods to process large spectral datasets.

# MESA Track can support...

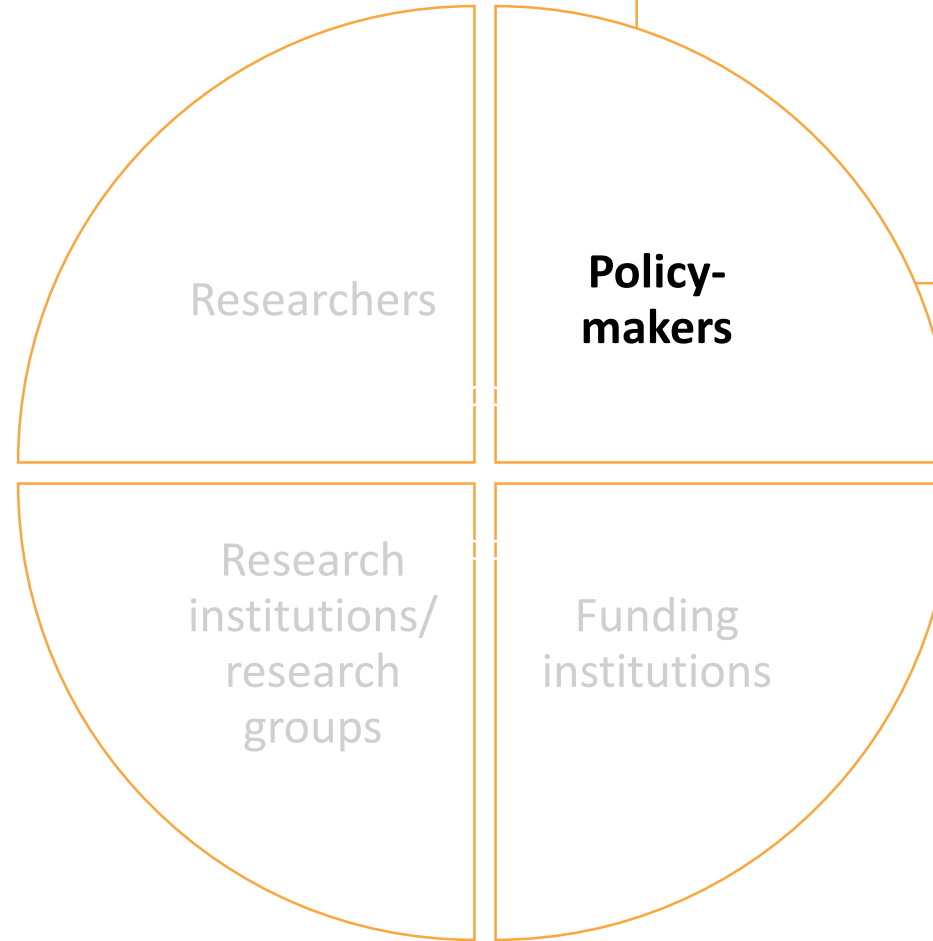

# MESA Track can support...

- Tool to highlight own work and impact, increase its visibility
- Identify people working in the same area
- Explore collaborations, partnerships, etc.

## MESA Track can support...

- Evidence review exercises “Deep Dives”
- Identify new questions being asked
- Foresee emerging evidence
- Plan the timing for future revisions of guidance

# Evidence review exercises “Deep Dives”

In-depth profiling of critical topics

Useful for planning for and informing policy-making processes

Tool to analyze the research landscape and identify evidence gaps

## [ONGOING] Intermittent preventive treatment in infants (IPTi)

A WHO Technical Consultation to Review the Role of Drugs in Malaria Prevention for People Living in Endemic Settings took place on October 16 - 17, 2019 [ref].

23 OCT 2019

## [ONGOING] Intermittent preventive treatment in pregnancy (IPTp)

A WHO Technical Consultation to Review the Role of Drugs in Malaria Prevention for People Living in Endemic Settings took place on October 16 - 17, 2019 [ref].

22 OCT 2019

## [ONGOING] Novel uses of chemoprevention for malaria

A WHO Technical Consultation to Review the Role of Drugs in Malaria Prevention for People Living in Endemic Settings took place on October 16 - 17, 2019 [ref].

22 OCT 2019

## [ONGOING] Seasonal Malaria Chemoprevention (SMC)

A WHO Technical Consultation on Seasonal Malaria Prevention: Evidence for policy review will take place in October 14 - 15, 2019 [ref] with the aim of reviewing ways of optimising the implementation of the strategy and reviewing the existing guidance and constraints on its use.

08 OCT 2019

## mAbs for malaria vaccine development

A WHO consultation to discuss malaria vaccines and biologicals research and development, with the aim to review the state-of-the-art in malaria vaccine development including new developments in the field, key challenges and opportunities, was convened by WHO in July 2019 [ref].

04 OCT 2019

## Genetic Epidemiology

A WHO technical consultation to discuss what genetic epidemiology of malaria parasite and Anopheles mosquitoes can tell us about malaria transmission, antimalarial drug resistance, and a possible role as a surveillance tool was convened by WHO in June 2019 [ref].

04 OCT 2019

# Evidence review exercises “Deep Dives”

Malaria Policy Advisory Committee Meeting  
2–4 October 2019, Geneva, Switzerland  
Background document for Session 7

## Technical consultation on the role of parasite and anopheline genetics in malaria surveillance

5–7 June 2019, Geneva, Switzerland

# Evidence review exercises “Deep Dives”

Malaria Policy Advisory Committee Meeting  
2–4 October 2019, Geneva, Switzerland  
Background document for Session 7

## Technical consultation on the role of parasite and anopheline genetics in malaria surveillance

5–7 June 2019, Geneva, Switzerland

## Genetic Epidemiology

A WHO technical consultation to discuss what genetic epidemiology of malaria parasite and Anopheline mosquitoes can tell us about malaria transmission, antimalarial drug resistance, and a possible role as a surveillance tool was convened by WHO in June 2019 [ref].

To facilitate the technical consultation's work, MESA is compiling a landscape of recent and ongoing research in genetic epidemiology and its role in malaria surveillance. Additional information and inputs are welcome, please do not hesitate to contact us ([mesa@isglobal.org](mailto:mesa@isglobal.org)) to add your research project to this ongoing Deep Dive.
